

priors for Bayesian model uncertainty

Dr. Merlise Clyde

Zellner's g-prior

sampling model

$$Y_i \mid \beta_0, \beta_1, \dots, \beta_p, \sigma^2 \stackrel{\text{ind}}{\sim} \mathbf{N}(\beta_0 + \beta_1(x_{i1} - \bar{x}_1) + \dots + \beta_p(x_{ip} - \bar{x}_p), \sigma^2)$$

informative conjugate prior

$$\boldsymbol{\beta} \mid \sigma^2 \sim \mathbf{N}(b_0, g \sigma^2 \mathbf{S}_{\mathbf{X}\mathbf{X}}^{-1})$$

- ▶ informative prior mean b_0
- ▶ scaled variance (and covariances) from OLS
- ▶ g controls precision

posterior with Zellner's g-prior

- ▶ posterior mean

$$\frac{g}{1+g} \hat{\boldsymbol{\beta}} + \frac{1}{1+g} b_0$$

- ▶ posterior variance (given σ^2)

$$\frac{g}{1+g} \sigma^2 \mathbf{S}_{\mathbf{X}\mathbf{X}}^{-1}$$

- ▶ posterior distribution

$$\boldsymbol{\beta} \mid \sigma^2, \text{data} \sim \text{N} \left(\frac{g}{1+g} \hat{\boldsymbol{\beta}} + \frac{1}{1+g} b_0, \frac{g}{1+g} \sigma^2 \mathbf{S}_{\mathbf{X}\mathbf{X}}^{-1} \right)$$

Bayes factor

- ▶ Zellner's g prior for coefficients in model m with $b_0 = 0$
- ▶ reference prior for intercept and variance $p(\beta_0, \sigma^2) \propto 1/\sigma^2$
- ▶ Bayes factor of model m to null model \mathcal{M}_0

$$BF[\mathcal{M}_m : \mathcal{M}_0] = (1 + g)^{(n-p_m-1)/2} (1 + g(1 - R_m^2))^{-(n-1)/2}$$

$$\frac{p(\mathcal{M}_m | \text{data}, g)}{p(\mathcal{M}_0 | \text{data}, g)} = BF[\mathcal{M}_m : \mathcal{M}_0] \frac{p(\mathcal{M}_m)}{p(\mathcal{M}_0)}$$

choice of g

$$BF[\mathcal{M}_m : \mathcal{M}_0] = (1 + g)^{(n-p_m-1)/2} (1 + g(1 - R_m^2))^{-(n-1)/2}$$

- ▶ Bartlett/Lindley paradox $g \rightarrow \infty$ then $BF[\mathcal{M}_m : \mathcal{M}_0] \rightarrow 0$
- ▶ information paradox

for fixed g as $R^2 \rightarrow 1$ Bayes factor is bounded

- ▶ unintended consequences of choice of g

solutions

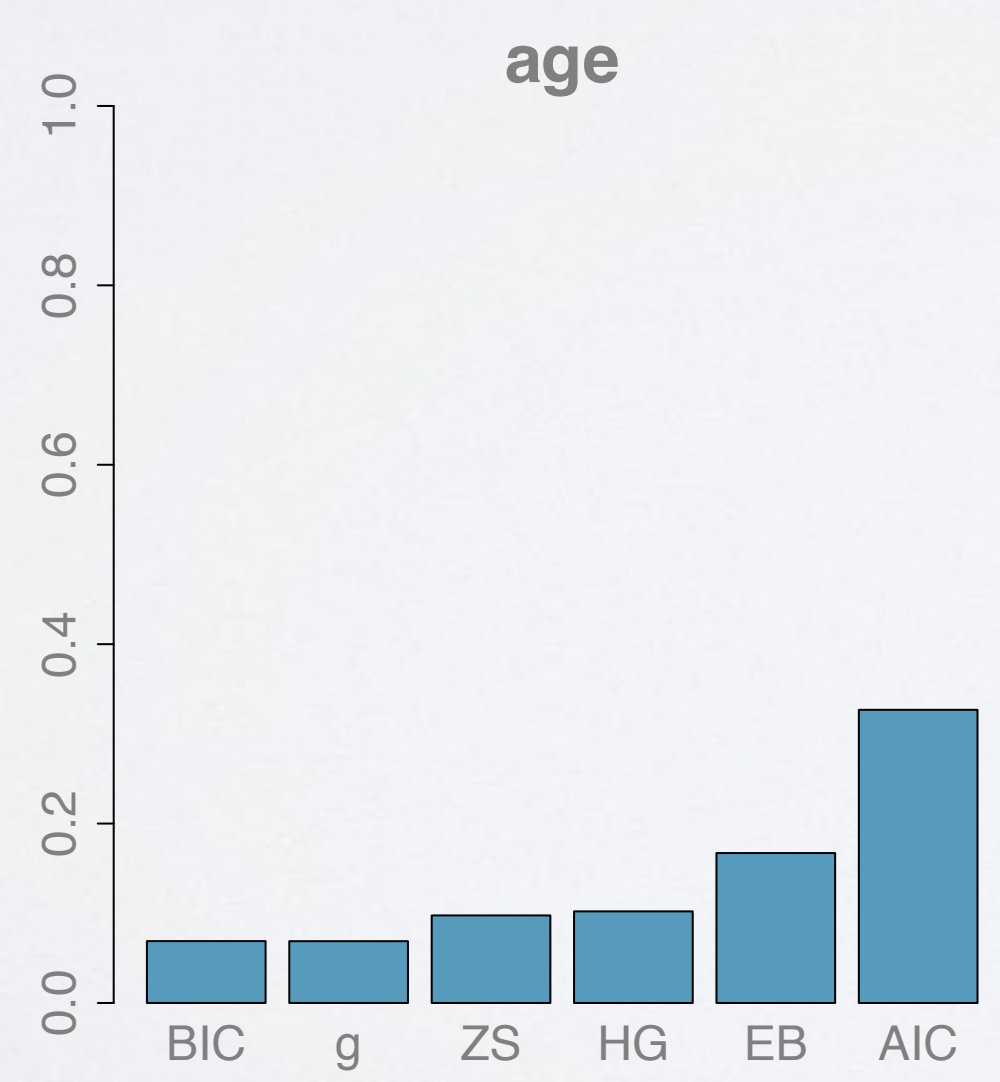

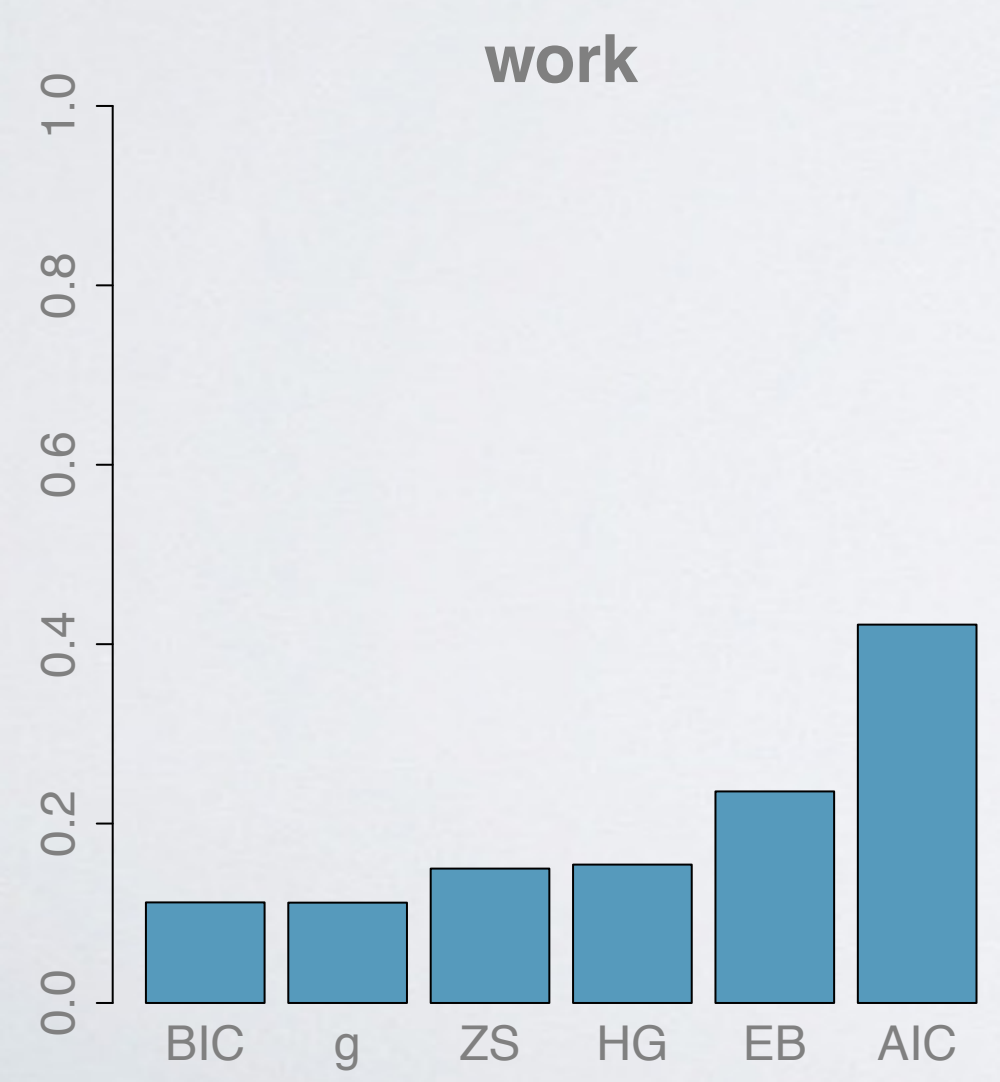

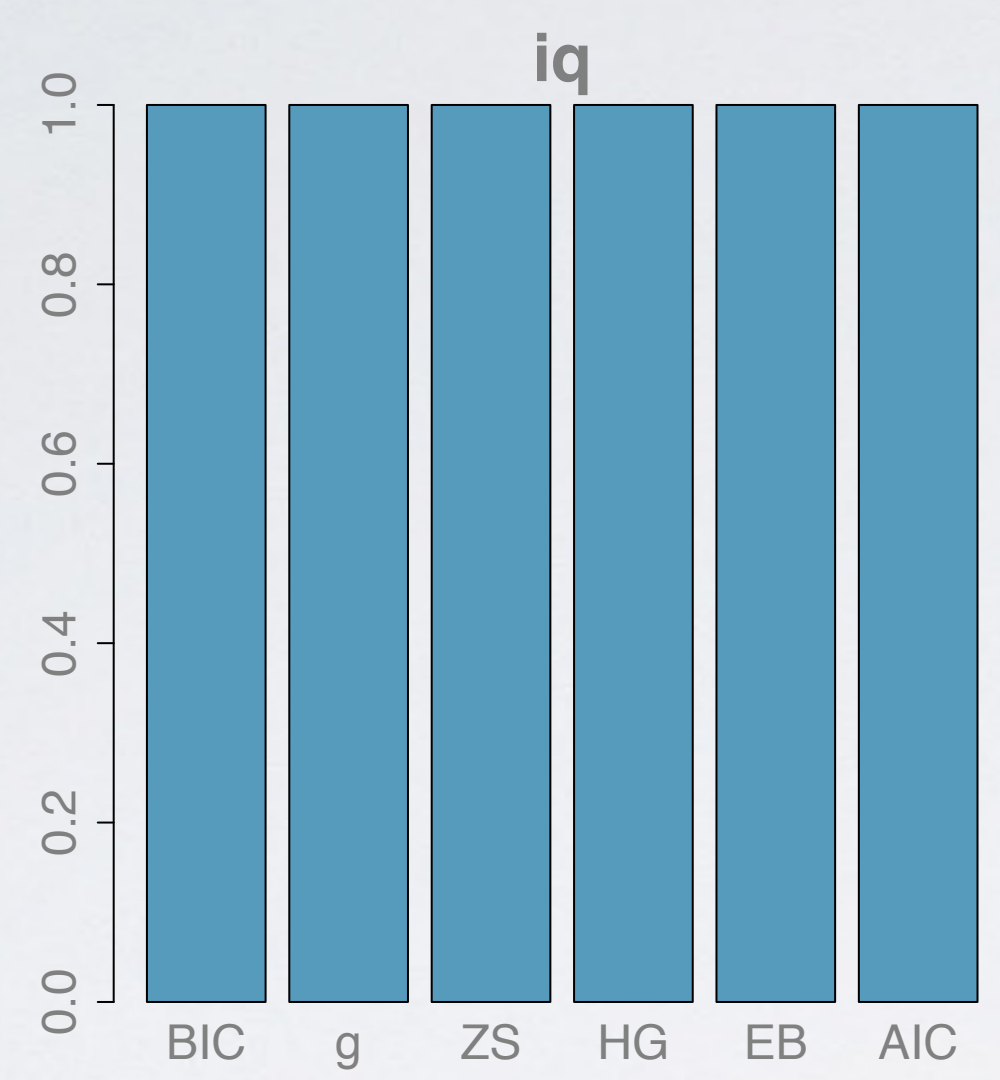

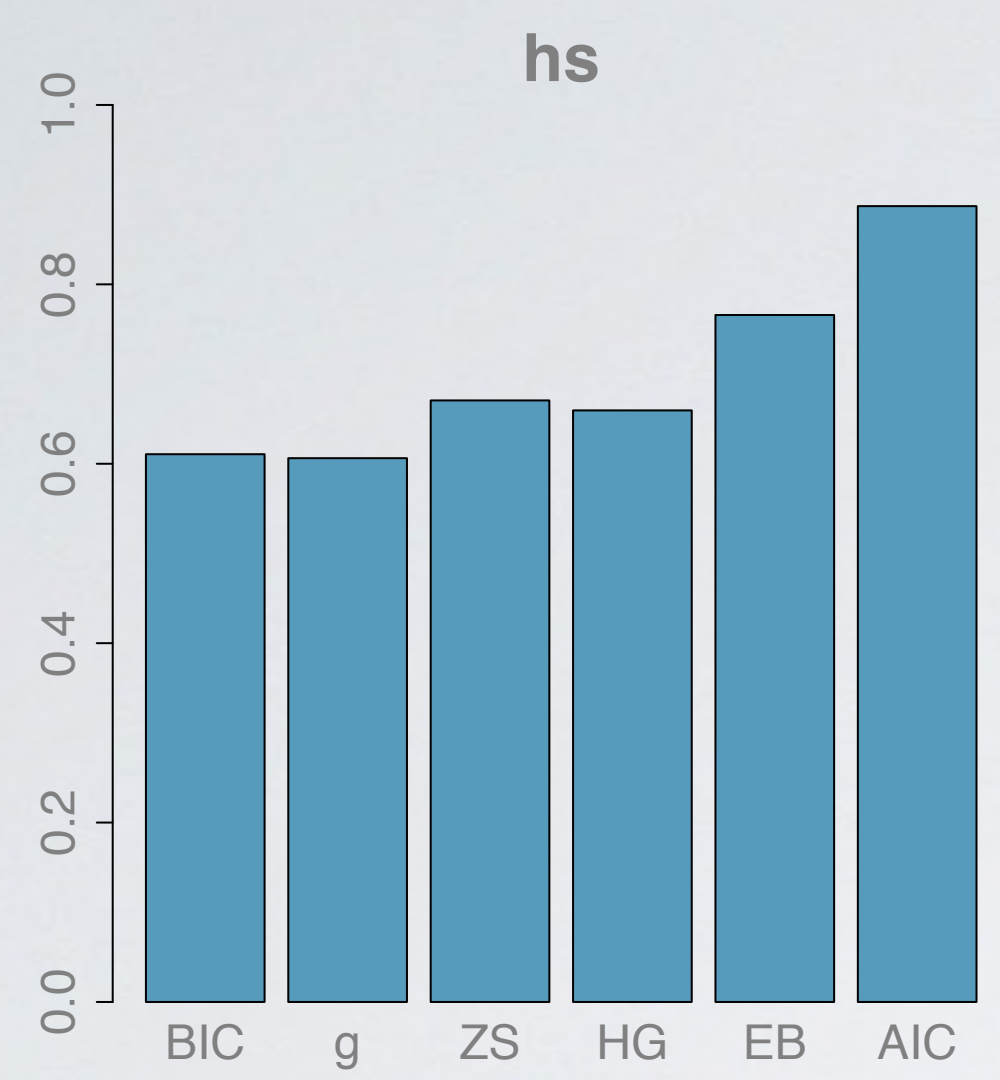

let prior depend on n

unit information $g = n$

Zellner-Siow cauchy $n/g \sim \mathbf{G}(1/2, 1/2)$

hyper-g/n $\frac{1}{1+g/n} \sim \text{Beta}(a/2, b/2)$

sensitivity: posterior inclusion probabilities

summary

- ▶ introduced Zellner's g prior
- ▶ choice of g
- ▶ sensitivity of posterior inclusion probabilities

next

- ▶ example
- ▶ reporting with model certainty
